(54) Title: EDITING OF REAL TIME INFORMATION ON A RECORD CARRIER

(57) Abstract: A device for real-time recording information has a file subsystem for storing the real-time information according to predefined allocation rules, including a predefined extent length (N). The device has an application subsystem for managing application control information, which includes clips (291, 292) of the real-time information, a playlist of playitems indicating parts to be played of the real-time information in the clip. A bridge clip (293) is provided for linking a first and a second playitem based on re-encoded real-time information from an ending part of the first clip and a starting part of the second clip. The file subsystem is arranged for copying additional units of real-time information (294) from the first clip and/or the second clip for creating the bridge clip stream having at least the predefined extent length, and the application subsystem is arranged for adapting the application control information for accessing the bridge clip stream including said additionally copied units. In borderline cases the remaining part of a preceding or following clip is completely copied to the bridge clip.
